Also, we assumed that the numbers and lifespan of mosquitoes collected from the habitats were the same for each study. In reality, the numbers and lifespan of the mosquitoes are likely different in the various habitats. Thus, the larval habitat-based assessments of the relative attractiveness of different habitats to mosquitoes might have underestimated or overestimated the attractiveness of these habitats to mosquitoes. The larval habitat-based assessment was conducted in the early stages of the experiment. Therefore, we cannot say whether the observed differences in behavior of mosquitoes are a cause or effect of the observed differences in the mosquito's response to infection. Additionally, we did not include a control habitat in our study. This was because the *A. albopictus* larval habitats were established in areas where there were no humans. As a result, all of the habitats were highly accessible to humans and were therefore not suitable for the control habitat. In the future, studies that include control habitats are needed to demonstrate the value of larval habitat-based assessments. Overall, this study illustrated how larval habitats can be used to evaluate the relative attractiveness of different habitats to mosquitoes. The results show that the different larval habitats are effective for collecting mosquitoes. Future studies using larval habitats will help researchers to choose the optimal larval habitat for the target species. The results of these studies could be useful for the design

of mass trapping stations for mosquitoes that are competent vectors of dengue, chikungunya, and zika virus. The mass trapping technique, in which thousands of traps are deployed simultaneously, is considered to be one of the most effective ways to control vector populations ([@ref-12]). It is important to choose an appropriate larval habitat for the target species. For instance, in the present study, the numbers of *A. albopictus* were more than twice those of *A. aegypti* in larval habitats with floating planters. Thus, if the goal is to collect *A. albopictus*, the habitats with floating planters are appropriate for this purpose. In this context, 2d92ce491b
