A: After a long day of searching, this is the solution to map backup: Click on the map on the launch screen of the modpack. Click on File > Save as > "Map Backup - Home Sweet Home". Pick where you want to save the file, it will probably be inside the modpack folder. Click on the OK button. Map will appear in the folder. It should be like: File name: HomeMP.zip Size: 5.90 MB Hope this helps!

Q: How to increase performance of T4 file template? I am working on web application in which we are using T4 file template for code generation. I would like to increase the performance. We are using latest T4 nuget package. How to increase the performance of code generation? I am having architecture like following: Web application Scheduled job(scheduled cron based) which will update the Web application code to latest. We have less data in our application so want to reduce the time for each generation. Any help is really appreciated.

A: You need to look at how your current template is behaving and how you can make it run faster. I've run into problems before with T4 templates because they take too long to run. The problem was that I had some very complex code in my templates that was not related to just the code generation. This was getting in the way of just the templates "running". In other words, the template was putting a noticeable delay in the program output. Your problem sounds a bit like this one.

Q: gulp-notify, notify service not running I am trying to integrate notify into a new gulp project. I added this to my config.js: `var gulp = require('gulp'); var notify = require('gulp-notify'); gulp.task('default', function () { gulp.watch('./src/**/*.{js,html}', ['notify']); });` and this to my gulpfile: `'use strict'; var gulp = require('gulp'); var notify = require('gulp-notify'); var config = { paths: { 2d92ce491b`
