Q: iText: Embedded (single) PDF file is larger than a (multiple) PDF-document? I have a problem, which is the following: I have a single (one-file).pdf file, containing around 170 pages. I tried to create a pdf-document, which contains all these pages (170, i guess). It takes about 20 min. (until it is over). My problem is, the size of this.pdf file is a lot bigger than the single.pdf file which contains all the content. I used the PdfCopy-method to create a copy of the single file (copy-method is working properly). I used the PdfCopy-method, to create a copy of the single file (it copies the content, but the PDF is created until the end of the single file). What I was expecting is, the single file will be copied in the other file with 170 pages, but the size of the other file (PdfCopy) is to be the same size as the single file. I used the following code, to create a copy of the single.pdf file. How can I change my code, to make the PDF size become the same size like the single file? Notes: The single file is larger than the other PDF-file (the content itself). I have already thought about that, because of the many pages in the other document, it contains the content more quickly, than the single file. I think there must be a solution to avoid that. The single file is larger than the other document, because I made the pages bigger, to be able to print them, and the content gets spread over 2 pages, when I have a PDF-document. I don't want to use other PDF-software, for that matter, because I want to work with iText, instead of this third party software. I also think that I can use itextpdf version 2.1.7 Here is the code, that I use to create a copy of the single PDF file (which contains 170 pages):

```
protected String createPdf(String sourceFile, String destFile) { try { Document document = new Document(PageSize.A4); PdfWriter writer = P
```

Theaetetus Dual Audio . Tadap Full Movie Torrent download in high quality for free. These are most popular torrents for the movies,TV series and games.
