I hope this would be very useful for you as well.Q: What are the benefits of using a JMX service? I'm trying to understand why people (be it vendors or people trying to sell a solution) are suggesting JMX services as an alternative to using JMX. What are the benefits of using a JMX service vs JMX? A: The benefits of using a JMX service are: It is a standards based service, JMX has the backing of the Java community and the service is quite well defined It has a plugin architecture. You can plug it into most things so you don't have to build your own JMX service If you have a proprietary JMX service, you can extend it from the JMX service. If you have your own proprietary service, you can use it as a facade for a JMX service. A: JMX is a standard way of looking at an application. If it implements an interface, and exposes properties for that interface, you can access it via JMX. The service (or product) could be a thin wrapper around some other JMX interface, or a whole-system-thingy. If your application doesn't expose an interface for querying, then it might be a good candidate for a JMX service. Or it might be a good candidate for integration with something else. "The Democratic and Republican leadership of the House and Senate are committed to working together to achieve common sense solutions to the challenges posed by the Affordable Care Act," wrote House Minority Leader Nancy Pelosi (D-Calif.) and Senate Minority Leader Mitch McConnell (R-Ky.) in a filing with the U.S. Supreme Court. "That cooperation will be facilitated by 2d92ce491b
