A: I would suggest using the Shatter modifier to add the cracks to your model. Since you have a 3D model, it will be easier for you to control the placement of the cracks. If you have the ability to sculpt a nice mesh then you can modify the model to look like it is cracking (decreasing the polycount, maybe adding texturizing). If you can't sculpt, then you could use the Shrinkwrap modifier to add cracks to the model. A: It has been a while since I last used the scene editor. But looking at how the structure of the original model was done you might be able to use this as a template. Basically the idea is that you model the mesh to have horizontal and vertical creases going across. Then at the middle of the creases model a cylinder with a capsule modifier. The cylinder's scale and orientation will dictate how much of a gap there will be between the sides of the creases. The spheres on the ends of the cylinder will represent the vertical and horizontal cracks in the model. They should be smaller than the gap in the creases. Agronomicus Agronomicus is a biannual peer-reviewed scientific journal published by the Austrian Academy of Sciences (ÖAW) on behalf of the Central Bureau of the Austrian Statistical Office (Statistikamt). The journal was established in 2011 and its purpose is to provide up-to-date information about developments in the field of agricultural economics. It publishes original research and review articles, particularly those focusing on historical aspects. The journal is abstracted and indexed in the Current Contents, Scopus, and the Social Science Citation Index. The purpose of the present study was to determine whether the adenosine receptor (AR) agonist CGS 21680 was able to induce ventricular tachycardia (VT) and whether the AR antagonists 8-cyclopentyl-1,3-dipropylxanthine (D
