- FreeImage library is written in C++. - Functions are available in static and dynamic linking. - Three OpenMP functionalities are supported: multi-threading, parallel processing and CUDA support. - All functions are configurable with a simple configuration file. - Based on a powerful and handy structure of abstractions, Freetype support is offered. - There are no restrictions for the application runtime regarding the supported and used operating systems. - The library does not support any architecture. ===== IMPORTANT NOTICES, INFORMATION AND DETAILS OF DOCUMENTATION AND/OR OTHER MATERIALS. OpenMP support is now in unstable state. The future of the OpenMP support is not guaranteed. The current OpenMP support features are usable, but might not be always fully stable. What's New In?

===== In FreeImage you will find a file conversion system, image manipulation routines and an image file format parser (source code and tutorial). The conversion engine is well-known, widely supported and easy to use. It is very robust and can be used for formats that are not widely supported or for special cases. The manipulation routines are easy to use (read and write, create, transform, resize,...). There are no generic functions but direct access to the native files, so it will be quick and easy. The parser, that allow you to read images and files in formats that are not supported by the library, is fast and reliable. Background ===== Since the release of FreeImage v1.0.0 in 2002, it has been developed to be a core library for free and open source software. The project started as a fork of the discontinued PIL (the Python Image Library). FreeImage works as a standalone library and has support for more than 60 image formats. The library is extremely simple to use and it is not limited to the local PC (unique FreeImageIO). The main goals of FreeImage is the simplicity of the library. The software development for a long time has been focused on writing the native routines for the most common formats and on providing a good documentation. Thanks to the support of the FreeImage project, some of the common formats, like BMP, GIF, JPEG, PNG, TIFF and JFIF, are supported in a large number of applications. Features ===== Simple conversion engine Built-in support for hundreds of common formats Built-in support for some of the most common filters and operators (resize, rotate, crop, etc.) Built-in support for saving images in files format that are not supported by the library (ASCII, Encapsulated PostScript, etc.) Plugins for external format converters Plugin for an external formatter (rasterizer) that support reading and writing images Future releases ===== Future versions will try to maintain compatibility with older versions. If a new version is released, it will not break existing FreeImage code, but to avoid any doubt, it is important to upgrade to the next version. Interaction with the library ===== Many formats are built in the library, or the conversion engine, but also they can be loaded through plugins. If you need a format that is not natively supported by FreeImage, you can add the plugin that will provide the support. The feature list is described in plugins.txt. Documentation ===== Some of the formats are documented with unit tests. Dependencies ===== FreeImage has no other dependencies. API ===== The software is released under the GNU GPL license. The software contains a
