## WikiVis Crack Free Download For PC

WikiVis Crack is a special type of graphical visualisation of the Wikipedia category-article hierarchy, and shows how the information space is structured, how it changes over time, and what it looks like. Why does it work: WikiVis Crack Mac was originally designed to interact with the Wikiproject data in order to map the Wikipedia category-article hierarchy and display the graph in three-dimensional space. But it can also be used for displaying any web-accessible category-article hierarchy. If an article lies close to the 'main page' or any of the other articles that belong to its category, it is ranked higher than any articles which are further away from it. If you have a category-article diagram in Wikipedia, or you have the category-article diagram for a web-accessible category-article diagram, you can put it in Wikivis, and WikiVis will map it in three dimensional space, displaying the spatial layout, the changes over time, and 'what it looks like' (so as to make sense of it). How does it work: WikiVis is implemented as an Eclipse plug-in, with a graphical 'welcome screen' from which Wikivis is launched. After this, you configure WikiVis through a very simple graphical interface which allows you to edit the hierarchy, view its history and change the settings of WikiVis. The visualisation is based on Java 3D and JavaPixmap. It uses the well established Java programming language to achieve its result. You can interact with the basic graphical elements of WikiVis using the mouse or a keyboard or by dragging a selection box around some part of the diagram. The Wikipedia category-article hierarchy is available in Java as Wikinews, and a Java 3D widget called Wikivis can read it and is used for the visualisation. Wikivis now has been made into an Eclipse plugin, so that it can be easily installed and updated. How to install it and use it: You can download a standalone Windows version as well as a Mac OS X version of WikiVis from the WikiVis home page, or you can read the instructions in the file 'WikiVisInstallation.txt' from the WikiVis home page. After you have installed it, and made any suitable configuration changes (for example, adding the Wikipedia category-article hierarchy into Wikivis as a

## WikiVis Crack + Keygen Full Version (Final 2022)

WikiVis is a side project developed by Alexander Breuer at the workshop LAC at Johannes Gutenberg University Mainz to browse Wikipedias interactively. The project is still in development. This website serves as a supporting documentation for the wiki-based approach implemented in the software. Feel free to play with it. Please keep in mind that Wikipedia articles and page titles are not always appropriately translated and there might be even words missing. Therefore the information presented here is only intended as a short preview. There are three key columns in the WikiVis UI: Categories (left), Articles (middle), and Tags (right). The Category column can be used to list all the categories in an order which resembles the Wikipedias hierarchy. You can browse the Category column and select categories on click. The Articles column is about both articles and pages in the sense that it will list all articles (e.g. pages) that are linked from pages under the selected category. For example, if the category pagen is selected, it will list all pages that have pages that are linked from it. You can also click on any page or article to jump to it. The Tags column lists the list of tags (or categories as it is described in Wikipedia) that are found on the selected article. Clicking on a tag enables you to jump to the selected article. Please note that the software is currently still in development. You can use the keyboard shortcuts for the whole application by pressing the combination Ctrl + C in order to move between categories, Ctrl + A to select all articles, and Ctrl + N to select all tags. With all the articles selected you can simply press Ctrl + Y to jump to the articles table. More details can be found in the WikiVis Manual.The present invention relates to an array substrate for a liquid crystal display (LCD) and a method for fabricating the same. More particularly, the present invention relates to an array substrate, which has improved electrical and mechanical characteristics, and a method for fabricating the same. An LCD is one of the flat panel displays most widely used nowadays. An LCD includes two substrates with field generating electrodes such as a pixel electrode and a common electrode formed thereon and a liquid crystal layer interposed between the two substrates. The liquid crystal layer is aligned in accordance with the direction and strength of an electric field generated by a voltage applied to 09e8f5149f

## WikiVis Crack+ With Full Keygen [Mac/Win]

WikiVis can be used to create a web-based snapshot of the articles, categories or keywords in a given section of Wikipedia. You can also add annotations to the snapshots and search for content. In doing so, WikiVis enables you to navigate the article category hierarchy as well as the article links within Wikipedia. You can search over specific article categories. WikiVis differs from other wikisimulators because it allows users to interactively explore the article network, adding links between articles and seeing what categories they belong to. **Category Decoration:** A category decoration is a feature of the application allowing users to highlight a category in an 'agenda view' (which is a snapshot of an article category and all of its child categories). You can perform a search and when a category is highlighted, a box appears with links that allow you to move between the highlighted category and its sibling categories. The intention is to allow you to quickly find the content that you are looking for in a more powerful way than a simple link can provide. **Assigned Colors:** Each and every category of WikiVis is assigned a color. This color is used in the categories that are highlighted. And, where applicable, the links are assigned a color as well. This allows a user to quickly locate relevant content without having to search through all categories. **External Linking:** External linking allows you to link to other Wikipedia articles. You can therefore view Wikipedia articles that are relevant to the article you are currently viewing. The application allows you to link within Wikipedia or to external websites. If you wish to link to Wikipedia, simply select the 'Connect' button. If you wish to link to an external website, you will need to select the 'External' button. **Database Settings:** WikiVis is a Java application. The configuration of WikiVis is stored in a database. This allows us to save the settings with each snapshot taken, and use them to view a previous snapshot. Change the settings using the Configure menu. **Settings used in the screenshots are listed here:** Settings: Category name: Art, History Category color: Orange Website: Website link color: Green Assigned colors: Category name: Arts, History, Philosophy Category color: Blue Category name: Architecture, Engineering, Mathematics Category color: Purple Ass

### What's New in the WikiVis?

WikiVis is designed in order to allow the user to explore the structure of Wikipedia in an innovative way. Visually, the dynamic parts of the website are mapped to the article content, while the static parts of the website are mapped to the category structure. This classification is based on the old classification system created by Larry Sanger and Daniel Brandt, used for the launch of Wikipedia. For more information, please visit the WikiVis project page. **Contents** The WikiVis visualization is based on Geo3D, and uses a Google Sketchup model of Wikipedia, from the Wikimedia Foundation. The engine also uses a Google Web GL library, which allows the map to be viewed in a web browser. The engine is currently in test phase, and will be in public testing in a few days. While the engine is being tested, the stable version is also available at for testing purposes. The WikiVis visualization allows the user to navigate through the Wikipedia network by comparing the static part of the site (the category hierarchy) with the dynamic part (the article hierarchy). The user is then presented with a Google Sketchup model of Wikipedia, where every article is represented as a cube (or sphere, if applicable), with its category. Aside from exploring the structure of the Wikipedia category hierarchy, WikiVis can also display the article hierarchy. The article hierarchy is then displayed as a pyramid, with the most frequent articles at the top of the pyramid, and articles descending to less frequently appearing articles. The list of articles is generated on the server side, and is cached on the client side. The client side renders every article of the user (i.e., every wikipedia.org user) that is already cached. If the client side has not cached an article, it is then requested from the server. This way of presentation allows the user to investigate the article history at the article level. Each article has its article list, in which the most frequently appearing articles are listed first, in descending order of their frequency. Also shown are the number of revisions (that are not visible on Wikipedia) for every article. WikiVis lets you see the most striking features on Wikipedia. Since Wikivis is primarily designed as a means of browsing the Wikipedia category hierarchy and its article network (map), Wikivis does not
